

Gbadamosi Tolulope

Full-Stack Software Engineer

CONTACT

07057586445
tolulopegbadamosi644@gmail.com
Lugbe, Abuja

SKILLS

Languages: Python, JavaScript (ES6+), SQL, HTML/CSS
Backend & Databases: PostgreSQL, Redis, Node.js, RESTful APIs
Architecture & Security: Data Encryption standards, ACID compliant ledger design, Session Management
Infrastructure & Tools: Linux/Ubuntu (WSL), Git/GitHub, CI/CD Deployment (Render), Workflow Automation
Core Competencies: Full-Stack Development, System Diagnostics, Secure Authentication, AI-Native Development Workflows

PROFILE

A full-stack software engineer focused on building secure financial infrastructure, advanced data encryption, and automated workflows. Proven ability to operate with high autonomy and sharp execution under minimal supervision, transitioning complex project requirements into production-ready code. Expert in bridging Python/PostgreSQL backends with clean JavaScript frontends to deliver reliable, high-performance systems.

WORK EXPERIENCE

- Independent Software Developer** Apr 2026 - May 2026
Full-Stack Software Engineer
Project CENTURION: Architected and deployed a secure, high-integrity banking ledger utilizing Python and SQL, focusing on transactional consistency and ACID compliance. Engineered the primary relational database schema using PostgreSQL to securely manage multi-user financial data. Implemented Redis caching to handle high-frequency reads and session validation, significantly reducing database load and improving system latency.
- Independent Software Developer** Mar 2026 - Mar 2026
Full-Stack Software Engineer
PROJECT VAULT X2: Developed a dedicated security module designed to handle and protect sensitive user data. Implemented modern cryptographic standards to ensure data remains fully encrypted both at rest and in transit. Designed the backend logic to prevent unauthorized access, demonstrating a strong understanding of application security and data privacy.
- Independent Software Developer** Apr 2026 - Apr 2026
Full-Stack Software Engineer
PROJECT AUTO-TM NG: Built a next-generation workflow automation engine designed to streamline repetitive tasks and optimize system processes. Programmed complex task sequences through a clean interface, effectively reducing manual operational overhead. Developed and tested the entire system within a native Windows Subsystem for Linux (WSL/Ubuntu) environment to ensure complete parity with production servers.

EDUCATION

- Telecommunication Engineering** Jul 2019 - Oct 2025
FEDERAL UNIVERSITY OF TECHNOLOGY MINNA
